## Appendix D. Notes on the Use of 64-bit

## Data Type

cMT / cMT X Series models offer 64-bit data type support. The following explains limitations on the use of 64-bit data type.

- Input ranges (Numeric object, Set Word object...etc)
i. unit64: $0 \sim 2^{\wedge} 48$
ii. int64: - $2^{\wedge} 48 \sim^{\sim} 2^{\wedge} 48$
iii. double: $-2^{\wedge} 48 \sim 2^{\wedge} 48$
- int64 / unit64

Double is the internal data type used in computation, while it stores a mantissa with 52-bit precision. As a result, 15 -digits integers and a portion of 16 -digits integers may be stored exactly, but storing numbers exceeding that may result in lost precision.
In EasyBuilder Pro, inputs exceeding 48-bit may result in error; therefore, the input limit is defined as 48-bit.

- double

In EasyBuilder Pro, the upper/lower input limit was formerly determined by the max/min of double (+/-1.79 * 10^308), which is nearly limitless in practicality. For consistency, the upper/lower input limit is also defined as $-2^{\wedge} 48 \boldsymbol{\sim}^{\wedge} 2^{\wedge} 48$.

## Example:

The value $144,115,188,075,855,872$ (a 64 -bit unsigned int. value) read from PLC may be displayed as $144,115,188,075,855,870$ by Numeric as precision is lost.

## Other circumstances:

As in the example above, the same problem may occur when using Recipe Import / SQL Query / Database (Data Sampling), where data is from an external source.

Please note that for double, as a floating-point number, precision issue is inherent. It should not be assumed that all numbers in the range $+2^{\wedge} 48^{\sim}-2^{\wedge} 48$ is guaranteed to display exactly. Explanations above should apply to the use of int64 / uint64 only.
